EDUCATION

UVCE

Bachelor of Technology in AI & ML — CGPA: 9.54/10

Bengaluru, India

2022 – 2026

EXPERIENCE

Software Engineering Intern – Backend / Platform

Jan. 2026 – Present

Syncron

Bengaluru, India

- Maintained pipeline isolation for 8-10 tenants on a centralized Mage.ai platform, where each tenant runs dedicated pods with isolated PostgreSQL, Redis and persistent volume configurations
- Debugged virtual service and OIDC auth mismatch errors, writing Envoy filters to enforce tenant-aware authentication at the service mesh level
- Built a POC for multi-tenant Kubeflow enabling multiple teams to run ML models simultaneously on a single cluster using KServe for model serving and Kubeflow for training pipelines
- Automated AWS resource provisioning and K8s manifest generation using Boto3 and the Kubernetes Python client, including dynamic YAML generation for tenant-specific deployments
- Improved overall test coverage from 50% to 70% and achieved 95%+ coverage on all new code through comprehensive unit and integration testing using pytest

PROJECTS

Satchel | *TypeScript, Node.js, Redis, React, TimescaleDB*

[GitHub](#)

- Designed sequential worker architecture eliminating race conditions in financial transaction processing without distributed locks, achieving sub-300ms average response time
- Decoupled order matching, wallet updates and market data publishing using Redis queues, enabling independent scaling of each pipeline stage
- Delivered real-time market depth via WebSocket APIs and persisted high-frequency trade data in TimescaleDB using integer arithmetic to ensure financial precision and avoid floating point errors.

Blimp | *Next.js, Node.js, Redis, BullMQ, Socket.io*

[GitHub](#)

- Offloaded write-heavy engagement event processing to Redis-backed BullMQ workers, reducing API response latency by 30% and improving reliability under high concurrency
- Built real-time messaging and notification infrastructure using Socket.io with Redis-backed state synchronization across connections
- Implemented user discovery with optimized partial match queries and debounced REST API calls, reducing unnecessary database load

Phantom AI | *React, Node.js, Redis, Firebase, Prisma, Gemini API*

[GitHub](#)

- Built an automated agent that joins scheduled Google Meet sessions and captures recordings without manual intervention
- Designed an async backend pipeline to extract audio, generate transcripts and produce AI-powered summaries, cutting manual note-taking effort to zero for end users
- Built a full-stack application with a React frontend for meeting management and a Node.js backend with background workers decoupled from the API layer for fault-tolerant recording processing

TECHNICAL SKILLS

Languages: C/C++, Python, JavaScript, TypeScript, SQL

Web & Backend: React, Next.js, Node.js, REST APIs, FastAPI, WebSockets, TailwindCSS

Cloud & DevOps: AWS EKS, AWS CDK, AWS Cognito, AWS S3, Docker, Kubernetes, Istio, Knative, KServe, Kubeflow, Boto3

Databases: PostgreSQL, MongoDB, Redis, TimescaleDB

Tools: Git, Linux, VS Code, Kafka, BullMQ, Agile/Scrum
